To whom it may concern

### **Recommendation Letter**

Geoarmatech is a leader in geophysical, geotechnical and control instruments in Iran. In our everyday activities we use different types of sensors and systems.

I can recommend R-sensors as a reliable supplier of seismic instruments.

We have been using R-sensors' seismometers and geophones for over 3 years. They are being used in monitoring systems to measure vibrations on historical buildings which have destructive effects from subway trains. As a result, new monitoring systems including both Geoarmatech and R-sensors' instruments are providing more reliable predictions compared to a general assessment method.

Several research articles were published to confirm reliability of these instruments.

We are sure R-sensors is and will be manufacturing products of as high output characteristics as the world's top level and within the required delivery terms.

We are going to use R-sensors' new and proven seismic instruments to provide value and benefits to our customers.
